Career Objective

My goal right now is pure growth through high-volume execution. I want to take on as many meaningful deliverables as I can sustainably manage, work alongside high performers, and continuously raise my baseline capability.

Education

Belgium Campus itiversity, South Africa	Hoërskool Zwartkop, Centurion South Africa
Bachelor of Computing Major: Software Engineering Expected Graduation: December 2026 Current average: 73%	Diploma Matriculated 2022 Distinctions in Math and English

Technical Skills

Programming languages: C#, Typescript, JavaScript, Java, Python

Frameworks: .Net Framework, .Net Core, Next.js, Playwright, Blazor, Swagger, Fluxor
Redux

IDE: Visual Studio, Visual Studio Code

Database: MS SQL, PostgreSQL, MongoDB

Practices: Clean Architecture, Object Oriented Programming, SOLID Principles

Projects

University

In University I built CRUD applications with different languages including Java and C#. I built Web Apps with restful API. I built a credit risk application in machine learning course with python.

Hackathons

2025 Monkey and River hackathon we built a next.js web application that used the Google Maps Api and using AI to give the user the lowest risk route for their known daily commute as to reduce the risk of injury and damages. We finished 2 in that hackathon.

2026 Monkey and River hackathon we built a Retrieval Augmented Generation AI assistant that was integrated with a CRM system, we used next.js again and used PostgreSQL to build the vector database for the RAG. We won this hackathon.

Internship

I built a Playwright application that is used for regression testing/ UI tests for a web app. My favourite part of this project was the authentication bypass I wrote for the tests so that they only needed to log in once and then all the tests could use the same cookie and did not have to start by logging in first for each iteration. Also used parallel execution to run several tests asynchronously.

I built an AI reader for pdf documents that users would usually have to manually input into the system. I implemented SOLID principles and token optimisation and prompt engineering in this project.

I rebuilt the data export in Blazor. Utilising swagger for the API controllers, Clean Architecture with SOLID principles.

Soft Skills

Friendly, professional, goal driven,
self-motivated, adaptable, trustworthy,
innovative, problem-solving, strong leadership abilities.

I enjoy working in a team. I see high value in a strong team culture with good co-operation.
